Método 1:

Como $z = \sqrt{1-x^2}$ é metade de um cilindro então:

$$V_{cilindro} = \pi r^2 h$$

$$V = \frac{1}{2} \pi r^2 h = \frac{1}{2} \pi 1 \cdot 4 = 2\pi$$

Método 2:

$$\int_{-2}^2 \int_{-1}^1 \sqrt{1-x^2} \, dx \, dy$$

Substituição trigonométrica:

$$x = \sin \theta \quad dx = \cos \theta \, d\theta$$

$$\cos \theta = \sqrt{1-x^2}$$

Se $x = -1$ então $\theta = -\frac{\pi}{2}$

Se $x = 1$ então $\theta = \frac{\pi}{2}$

$$\int_{-2}^2 \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \cos^2 \theta \, d\theta \, dy$$

$$\cos 2\theta = \sin^2 \theta - \cos^2 \theta \Leftrightarrow \cos^2 \theta = \frac{1 + \cos 2\theta}{2}$$

$$\int_{-2}^2 \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \frac{1}{2} (1 + \cos 2\theta) \, d\theta \, dy = \int_{-2}^2 \frac{1}{2} \left[\theta + \frac{1}{2} \sin 2\theta \right]_{-\frac{\pi}{2}}^{\frac{\pi}{2}} dy$$

$$= \left[\frac{\pi}{2} y \right]_{-2}^2 = 2\pi$$
